Kirsch, Alfred and Wepner, Wolfgang.  
ON THE CONVERSION OF CREEP VALUES TO  
OTHER TEMPERATURES. [1961] [13]p. 29 refs.  
Order from SLA \$1.60 61-16323

Trans. of Arch[iv für das] Eisenhüttenwesen (West  
Germany) 1957, v. 28 [no. 5/6] p. 339-344.

DESCRIPTORS: \*Steel, Creep, Temperature.

Creep curves for 19 ferritic and 19 austenitic steels  
were evolved by means of tests at two or more tem-  
peratures and were compared by the process after  
H. R. Larson and J. Miller. In most cases agreement  
was bad so that no success was had in plotting a  
'master curve' for these steels, neither was it possi-  
ble by changing the constant 20 in the formula after  
Miller and Larson by substituting C in the parameter  
 $L = 1.8 \cdot T(C + \lg t)$  where T = temperature in °K, and  
t = time in hours, particularly as, depending on the  
stress selected, another constant would result. On the  
(Metallurgy--Ferrous Metals, TT, v. 6, no. 3) (over)

Order from SLA m\$2.40, ph\$3.30 (1-10465

Trans. of Chemie-ingénieur-Technik (West  
Germany) 1957, v. 29 [no. 9] p. 393-399.

During condensation of vapors of a multicomponent  
mixture a relative movement of the components in  
the vapor is superimposed on the heat transfer. The  
result is that the temperature at the interface be-  
tween the phases is lower than in the main body of  
vapor. The temperature reduction itself is dependent  
on the one hand on the mass exchange index which,  
on the other hand, influences the heat transfer, in  
that only a part of the temperature gradient between
